Grave Varieties.

: Lozarstvo i vinarstvo, 1957, 6, No 3, 4-19 Orio Pub

Abstract : As the result of experiments conducted in 1952-1953 in the vineyards of labor concernitives, the authors have

reached the conclusion that the load of 8-10 eyes per plant, presently used on the establishments in Dulgaria, is insufficient. With the present agricultural technique it can be increased on the Dimyat, Vinenka, Red Museat and Mayrud varieties to 24 eyes, and on the Parid variety - to 32 eyes per plant both with short and long

pruning. Further increase in the fruit bearing, lead is

fensible with the improvement of the agricultural

TIPLE: Influence of Fertilizers on the Composition of the Assending Sup Stream in the Vine (Vlipanipe adetrenty to sortav vos-

khodynahohogo teka vinegradney long)

PERIODICAL: Deklady Akademi: nauk SSSR, 1959, Vol 189, Nr 6, pp 1367-1370

(USSR)

ABSTRACT: According to the data presented in assentific publications,

there is a difference in the uptake by day and the uptake by night of mineral substances by the plant (Refs 1,2): There are contain periods within which there is a rhythm of this uptake

(Ref 4). Soil difference also concerns the roots living

vegetation. It is connected with the plant's passing through its growth and levelopment stares (Refs 6,7). The authors tried to determine the influence of fortilizers on the sugar and amino acid contents of the liquid exulated on the "weeping" of

the vira. For this purpose the sais were collected of N-, P-, and K-fertilized as well as of unfertilized vines (Carchin variety, grafted upon Montikela). The sapa, in a five-fold

Girl 1/4 mesuum concentration, sore signatureph 1 (Refs 8.9), and the

507/20-125-6-54/6:

Influence of Fertilizers on the Composition of the Assending Sap Stream in the Vine

by the roots of nitrogen is effected rapidly, whereas its conversion into amino acids taken place in a certain sequence; at first alanine, and eventually disarboxylic acids are synthesized. The synthesis of the basic and aromatic amino acids is said to take place much later by means of trans-amination (Ref 17). Phosphorus fertilization probably also favored the increase in the amino acid content in the fertilized vines (Ref 18). The investigations by the authors have shown ammonium nitrogen to be taken up by the vine roots in an organic form. From there it is transported upwards into the individual organs in the form of various amino acids. The most intensive conversion of inorganic nitrogen into amino acids takes place during the first days after its application to the soil. There are 2 figures, 1 table, and 16 references, 12 of which are Soviet.

TEXT: The author proposes an interpretation of the method of E. Trefftz (Ref. 1: Verh. Kongress für technische Mechanik, Zürich, 1926, pp. 131-137) for the approximate solution of Dirichlet's problem for Laplace's equation, in circumstances where Hal'orkin's method is inapplicable. Abstractor's note: Hal'orkin's method not stated. The two-dimensional case of Laplace's problem is considered for a region bounded by a simple Jordan contour which may be expressed in parametric form: x = x(t), y = y(t) ($0 \le t \le 1$), where x(t) and y(t) are piece-wise elementary, and the contour is piece-wise smooth. By means of Keldysh's theorem [Abstractor's note: Theorem not stated [7], and the Gram-Schmidt orthogonalization]

On interpreting the method ...

process / Abstractor's note: Process not described 7, the solution is found in the form of a partial sum of a Pourier series. The following theorem is established: If the boundary function f(t) is continuous, then the nth approximation given by the partial sum converges uniformly to the solution of the problem as n in any region lying wholly within D, where D is the region bounded by the contour (1). It is recommended that the calculations arising from this problem be performed by a computer and programming details are given. The case of an arbitrary polygonal region is considered as an example. The necessary operations to be carried out are listed and suitable codes proposed for determining the polynomials in the basic program and for use in sub-programming. The details of the codes are given in tabular form. There are 5 tables and 10 references: 9 Soviet-bloc and 1 non-Soviet-bloc.

TITLE: Algorithm for the recognition of intelligent sentences

SOURCE: Printsipy* postroyeniya samoobuchayushchikhsys sistem (Principles of construction of self-instructing systems). Sbornik materialov simposiuma, 1961. Kiev, Gostekhizdat UkrSSR, 1962, 19-26

TOPIC TAGS: artificial intelligence, syntax, data recognition, learning, self-improving machine, learning algorithm, cybernetics

ABSTRACT: The problem of recognizing intelligent sentences of one particular type is formulated in the article. The authors consider a finite set of (Russian language) words (substantives, verbs and prepositions), from which sentences can be constructed according to the scheme:

c,e'(n,c,)*,

where c1 is the subject substantive; ~ is the predicate verb; n is the preposition; e2 is the object substantive. Let there exist either a list of all the intelligent sentences wh Card 1/3

ACCESSION NR: AT4016402

can be composed of the words of the prescribed set according to scheme (1) or a certain "object" capable of determining whether the sentence composed according to the scheme does or does not make sense. The authors' task was to construct an algorithm which, after processing a certain body of randomly selected sentences and establishing the pairwise correlations between the words of the initial set, could, in the first place, establish with a certain probability the intelligibility of formerly unencountered sentences; secondly, the algorithm was to reduce the possibility of incorrect answers as the number of processed sentences increases by making use of an estimation of the outcome of its work on each sentence and an estimation of the possibility of employing the list of all the intelligent sentences, and, thirdly, as the number of processed sentences increases, reduce the mean time in processing one sentence in comparison with the mean time necessary to review the list of all intelligible sentences. In order to realize the last two points, the principle of instruction with a "teacher" and the principle of self-instruction were used when formulating the algorithm. The authors describe in detail the development of the algorithm. Two stages are distinguished: 1) from the set of sentences which can be formed according to scheme (1) by using all the words of the initial group, (the number of which equals $nm(n^k + n + 1)$, where n, m and k are the number of initial substantives, verbs and prepositions, respectively), the smallest subset is selected which contains all the permissible sentences; 2) from the subset of all permissible sentences

TITLE: Some mathematical problems in the construction of a digital logical machine

SOURCE: Printsipy* postroyeniya samoobuchayushchikhsya sistem (Principles of construction of self-instructing systems). Sbornik materialov simpoziuma, 1961. Kiev, Gostekhizdat UkrSSR, 1962, 52-62

TOPIC TAGS: programming, logical design, machine organization, machine language

ABSTRACT: The article discusses certain considerations concerning the expansion of the design and operational capabilities of existing general purpose digital computers in terms of their adaptation to the solution of logical problems. It is pointed out that the peculiar properties of digital computers make it necessary to simulate the information and operations of logical problems in the language of arithmetic operational bits and elementary operations. The problems center around the problem of filling the memory of the computer, since the operative elements of information, which for their coding require k-place binary numbers, must be placed in 40-place cells. The difficulties considered lead, in the opinion of the author, to a two-fold result. In the first place, the programming of logical problems on digital computers, in itself a difficult task, is

Card 1/2

ACCESSION NR: AT4016404

artificially complicated by purely technical considerations. Secondly, during the solution of logical problems on digital computers there is an incomplete utilization of the wealth of operational possibilities made available by the machines. These difficulties have to do less with the actual programming of nonarithmetical problems than with their subsequent realization. Machine difficulties are said to be temporary in nature. The author has analyzed algorithms for the solution of certain standard logical problems and has formulated, on this basis, requirements for memory design and prescribed the set of operations useful in the machine solution of this class of nonarithmetical problems. Stogniy, A. A. (Kiyev)

TITLE:

Solving a problem associated with the differentiation of functions on an electronic digital

computer

SOURCE:

Problemy kibernetiki, no 7, 1962, 189-199

TEXT: Academician A. A. Dorodnitsyn has raised the problem of programming the construction and successive computation of a series for the solution of an ordinary differential equation in the vicinity of a singular point [Ref. 1: Konferentsiya "Puti razvitiya sovetskogo matematicheskogo mashinostroyeniya i priborostroyeniya", Plenarnyye zasedaniya, VINITI, 1956 (Conference on "Ways of development of the Soviet mathematical engineering and instrument-making industries", Plenary sessions, VINITI, 1956)].

It is known that a program for the differentiation of functions in one or more variables was compiled abroad, but the principles of its construction were not published.

The main ideas that underlie the construction of a program for differentiating

$$Z = f(x, y)$$
, where $y = y(x)$

and its use for solving an ordinary differential equation in the vicinity of a singular point are given in this paper.

Card 1/3

Solving a problem associated with...

S/582/62/000/007/007/008 1011/1211

Formulas are written down in Lukashevich's bracketless form thus enabling one to minimize the number of cells occupied by them in the memory without making the programming more complex.

The differentiation is carried out by two algorisms. The first carries the differentiation symbol D into the formula according to the laws of differentiation, while the latter differentiates the elementary functions according to a table of derivatives. The first of these algorisms is explained in detail verbally and by the use of a a graphic scheme.

A program for the differentiation of functions in one variable of MESM S. A., Lebedev, Dashevskiy L. N., Shkabara Ye. A., [Ref. 7. Malaya elektromnaya schetuaya mashina, Izd-vo AN SSSR, 1952 (The Small Electronic Computing Machine", AS USSR Publishing House, 1952)] comprises about 250 orders. Because of the

small memory of MESM the function $\ln \sin x + \frac{a}{\sqrt{x^2 - b}}$ was chosen for differentiation on it. A full list of the steps in this differentiation is

list of the steps in this differentiation is given

The existence of the differentiating program enables one to construct series with coefficients that depend on the values of the derivatives of a function at a given point. A program for the construction and computation of a partial sum of Taylor's series for a function given by an ordinary differential equation of the n-th order is discussed in principle. This solves the problem raised by Dorodnitsyn.

AUTHOR: Stognly, A. A. (Klev)

ACCESSION NR: AT4016489

TITLE: One structural variant of a digital machine for the conversion of alphabe-

SOURCE: Problemy* kibernetiki, no. 10, 1963, 151-163

TOPIC TAGS: computer design, digital computer, analytic differentiation, minimization, Blake method, abstract automation, image recognition, fixed address program, alphabetic information, alphanumeric conversion, logical problem, digital logic machine, operational memory

ABSTRACT: The author discusses the specific design and operational characteristics of digital computers which reflect the specific nature of the computational problems the machine is built to handle. It is pointed out that these particular features of the machine give rise to considerable difficulties when computers are employed to solve problems of a non-arithmetic character (logical problems). These difficulties are discussed. A second shortcoming encountered when using digital computers for the solution of logical problems is the incomplete exploitation of the rich operational capabilities of electronic machines. The presence of a large, and over-expanding, class of logical problems which are awaiting solution as well

。但由的**的种态,是是对对主体性的主体性的工作的主体性的工作的**,但是他们的特殊的一种的一种,但是是一种的一种的一种的一种的一种的一种,但是是一种的一种的一种,但是

ACCESSION NR: AT4016489

as the aforementioned difficulties encountered when attacking these problems on conventional digital equipment naturally led to the thought of the creation of what the author has called "digital logic machines" (DLM). In the present article, an attempt is made to formulate the structural requirements of the operational memory device (OMD) and the system of operations of a digital machine designed for the conversion of alphabetic information. In the development of these requirements the author has based his work on an analysis of a number of programs for the solution of non-arithmetic problems on the MESH, "Ural" and "Klev" electronic digital computers. These problems include the analytic differentiation of elementary functions, the minimization of Boolean functions by the Blake method, the synthesis of an abstract automaton according to the event represented by it and the simplification of the flow tables of an abstract automaton, the teaching of image recognition, an algorithm for the recognition of sensible sentences and some algorithms for equivalent transformations of formulas of the algebra of statements and the algebra of predicates. In separate sections of the article, the author considers: 1) the structure of the operational memory; 2) the system of operations; 3) the structure of the commands of the system. The memory of the machine in question is described as a sequence of numbered single-bit binary cells. The author also discusses the possibility of forming compound information words on the "content level"; that is, on the level at which the properties of the information elements themserves are taken into consideration. Because of the structure adopted in the

"APPROVED FOR RELEASE: 08/26/2000

CIA-RDP86-00513R001653320009-2

ACCESSION NR: AT4016489

operational memory device of the machine described in the paper, the limitation of a fixed address for the commands is eliminated. Each program command, responsible for the execution of one of the operations, is written in several cells; in the first command cell are found the code of the operation and the special attributes, while the subsequent cells hold the values or codes of the argument and the digital parameters of the given operation (address). ABSTRACT: An input language for a computer earmarked for engineering computations is described. The machine should: 1) handle limited problems since it is able to store a small amount of initial data; 2) use a simple input language and readily accept initial data; 3) handle the problem completely automatically; 4) incorporate a convenient (partially semiautomatic) setup for accepting and presenting information; and 5) be reliable and moderate in cost. The input language has much in common with the ALGOL-60 language except that it has a simpler program structure and a somewhat different description syntax. The article presents: 1) the basic symbols, identifiers, and numbers, 2) arithmetic expres-

feedback-loop functions (for combinational synthesis). A limited operating experience of the authors permits concluding that a "Kiev"-type computer (10000 operations per sec, 1024 40-digit elements in the internal storage) is suitable for automata synthesizing. In a discussion, A. Zakrevskiy stated that the above types of programs are liable to rapid obsolescence. A better solution would be to develop a special language based on simple and universal operators that constitute the synthesizing algorithms; such a special language could be coordinated with a general (e.g., ALGOL) language.
